

Trig Functions

$$\sin A^\circ = \frac{\textit{opposite}}{\textit{hypotenuse}}$$

$$\cos A^\circ = \frac{\textit{adjacent}}{\textit{hypotenuse}}$$

$$\tan A^\circ = \frac{\textit{opposite}}{\textit{adjacent}}$$

To find angles with trig functions, use inverse keys: $\sin^{-1} A^\circ$, $\cos^{-1} A^\circ$, $\tan^{-1} A^\circ$

Write the sine, cosine and tangent ratios for $\angle E$ and $\angle F$ in reduced form. You are not solving.

Find the value of x . Round lengths of segments to the nearest tenth.

Find the value of the angle. Round your answers to the nearest whole degree.
